L13 ANSWER 1 OF 1 MEDLINE on STN DUPLICATE 1
TI Purification and characterization of recombinant **pea**-seed
ferritins expressed in Escherichia coli: influence of N-terminus deletions
on protein solubility and core formation in vitro.
AB . . . Gagnon, Laulhere, Massenet, and Theil, E.C. (1990) J. Biol.
Chemical 265, 18339-18344], the function of which is unknown. A novel
pea-seed ferritin cDNA, with a consensus ferroxidase centre
conserved within H-type animal ferritins has been characterized. This
pea-seed ferritin cDNA has been engineered using
oligonucleotide-directed mutagenesis to produce DNA fragments (1)
corresponding to the wild-type (WT) ferritin precursor,. . . EP
deleted. These four DNA fragments have been cloned in an Escherichia coli
expression vector to produce the corresponding recombinant **pea**
-seed ferritins. Expression at 37 degrees C led to the accumulation of
recombinant **pea**-seed ferritins in inclusion bodies, whatever the
construct introduced in E. coli. Expression at 25 degrees C in the
presence of. . . by dialysis the r delta TP/EP protein showed a 25%
increase in core-formation in vitro compared with the r delta **TP**
protein. (ABSTRACT TRUNCATED AT 400 WORDS)
